## **BEST AVAILABLE IMAGES**

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

**IMAGES ARE BEST AVAILABLE COPY.**

**As rescanning documents *will not* correct images,  
please do not report the images to the  
Image Problem Mailbox.**

### Claim Amendments

13  
1. (Currently amended) A process for producing aligned carbon nanotube films, wherein a carbon compound is decomposed using a substrate ~~that is coated~~ prepared by the process which consists essentially of the steps of coating said substrate with an element having no catalytic ability by itself ~~and which loads~~ followed by coating the noncatalytic coating with a metallic element having catalytic ability ~~or a compound thereof~~, thereby forming a film of carbon nanotubes on the surface of said substrate which are aligned in a direction perpendicular to said substrate.

2. (Original) The process according to claim 1, which comprises the steps of coating the substrate with an element having no catalytic ability by itself, allowing a metallic element having catalytic ability or a compound thereof to be loaded on the substrate, and decomposing the carbon compound.

3. (Original) The process according to claim 2, wherein the element having no catalytic ability by itself is at least one element of groups IVa, Va, IIIb and IVb of the periodic table.

4. (Original) The process according to claim 2, wherein in the step of coating the substrate with the element having no catalytic ability by itself, said element is coated in a thickness of 5 nm to 100  $\mu$ m on the surface of said substrate.

B4

5. (Currently amended) The process according to claim 4, wherein in the step of coating the substrate with the element having no catalytic ability by itself, said element is coated in a thickness of 0.05  $\mu$ m to 5  $\mu$ m on the surface of said substrate.

6. (Original) The process according to claim 1, wherein the metallic element having catalytic ability is at least one metallic element of groups VIa, VIIa and VIII of the periodic table.

7. (Original) The process according to claim 2, wherein the step of allowing the metallic element having catalytic ability or a compound thereof to be loaded on the substrate is performed by impregnation, dipping or a sol-gel process.

8. (Original) The process according to claim 1, wherein the metallic element having catalytic ability or a compound thereof comprises particles with a size of 0.1 to 50 nm.

9. (Original) The process according to claim 8, wherein the metallic element having catalytic ability or a compound thereof comprises particles with a size of 1 to 20 nm.

10. (Original) The process according to claim 3, wherein the element having no catalytic ability by itself is aluminum or germanium.

11. (Original) The process according to claim 6, wherein the metal element having catalytic ability is cobalt.

12. (Original) The process according to claim 1, wherein the element having no catalytic ability by itself is aluminum and the metallic element having catalytic ability is cobalt.

13. (Amended) The process according to claim 1, wherein the substrate is a ceramic sheet.

---

14. (Currently Amended) A process for producing aligned carbon nanotube films, wherein a carbon compound is decomposed using a substrate that is obtained by allowing coating a ceramic sheet with an aluminum film to form an aluminum-coated ceramic sheet, next loading a cobalt compound to be loaded on an said aluminum-coated ceramic sheet and then calcining the resulting ceramic sheet to form said substrate, thereby forming a film of carbon nanotubes on the surface of said substrate which are aligned in a direction perpendicular to said substrate.

---

15. (Original) The process according to claim 14, wherein the cobalt compound is at least one member of the group consisting of cobalt nitrate, cobalt chloride, cobalt fluoride, cobalt bromide, cobalt iodide, cobalt sulfate, cobalt carbonate, cobalt acetate, cobalt naphthenate, cobalt octacarbonyl, cobalt phthalocyanine, cobalt hydroxide and cobalt oxide.

16. (Original) The process according to claim 14, wherein the cobalt compound is a suspension of cobalt hydroxide obtained by adding a base to an aqueous solution of a cobalt salt.

17. (Original) The process according to claim 16, wherein the cobalt salt is cobalt nitrate, cobalt chloride, cobalt fluoride, cobalt bromide, cobalt iodide, cobalt sulfate, cobalt carbonate, cobalt acetate or cobalt naphthenate.

18. (Previously amended) The process according to claim 16, wherein the base is ammonia or a water-soluble amine.

19. (Original) The process according to claim 18, wherein aqueous ammonia is used as the base.

20. (Previously amended) The process according to claim 14, wherein the cobalt compound which is loaded on the aluminum-coated ceramic sheet comprises particles with a size of 1 nm to 100 nm.

21. (Previously amended) The process according to claim 14, wherein the cobalt compound is loaded by impregnation, dipping, a sol-gel process or a reverse micelle process.

22. (Previously amended) The process according to claim 14, wherein the calcining temperature is between 300 and 800°C.

23. (Previously amended) The process according to claim 13, wherein the ceramic sheet is a porous ceramic sheet.

24. (Previously amended) The process according to claim 13, wherein the ceramic sheet is made of silica-alumina.

---

136  
25. (Currently amended) The process according to claim ~~13~~ 14, wherein the ceramic sheet is heated to dry before aluminum is deposited.

---

26. (Previously amended) The process according to claim 14, wherein aluminum is deposited by vacuum deposition, electrochemical deposition or sputtering.

27. (Previously amended) The process according to claim 1, wherein the carbon compound is at least one member of the group consisting of saturated hydrocarbon compounds, unsaturated hydrocarbon compounds, aromatic hydrocarbon compounds and oxygen-containing hydrocarbon compounds.

28. (Previously amended) The process according to claim 27, wherein the reaction temperature for the step of decomposing the carbon compound is between 400 and 1100°C.

29. (Previously presented) The process according to claim 14, wherein the ceramic sheet is a porous ceramic sheet.

30. (Previously presented) The process according to claim 14, wherein the ceramic sheet is made of silica-alumina.

31. (Previously presented) The process according to claim 14, wherein the ceramic sheet is heated to dry before aluminum is deposited.

---

32. (New) A process for producing aligned carbon nanotube films, wherein a carbon compound is decomposed using a substrate that is obtained by loading a cobalt compound on an aluminum-coated ceramic sheet, said cobalt compound being a suspension of cobalt hydroxide obtained by adding a base to an aqueous solution of a cobalt salt, and calcining the cobalt compound-loaded ceramic sheet, thereby forming a film of carbon nanotubes on the surface of said substrate which are aligned in a direction perpendicular to said substrate.

33. (New) The process according to claim 32, wherein said cobalt salt is cobalt nitrate, cobalt chloride, cobalt fluoride, cobalt bromide, cobalt iodide, cobalt sulfate, cobalt carbonate, cobalt acetate or cobalt naphthenate.

34. (New) The process according to claim 33, wherein the base is ammonia or a water-soluble amine.

35. (New) The process according to claim 34, wherein aqueous ammonia is used as the base.

---
